Trans. of Kislod (USSR) 1959, v. 12, no. 2, p. 38.

A method of determining the viscosity of compressed
gases at low temperatures is described. The gas
flows through two capillaries. One of the capillaries
is the working one and the gas flows through it at the
given pressure and temperature. The other is the
comparative capillary, the gas flowing through it at a
pressure close to atmospheric pressure and at room
temperature. The desired viscosity is proportional to
the ratio of the pressure drops in the capillaries. The
results of measurements of the viscosity of air and
argon are tabulated.
